6. Read the text and answer the questions with full answers. (20 points)

FOREST ANIMAL KINGDOM

A forest is home for many species of animals. Some of them are very big, others are small. They can be dangerous for people, harmful for other animals or plants or beneficial. They can play different roles in forest ecosystems. The most common and well-known animals include:

spiders, ticks, insects, snails and slugs, fish, amphibians, reptiles, birds and mammals.

Spiders have eight legs. They are predators so they build webs to catch other animals, usually insects, and feed on them. Spiders can be beneficial and reduce the number of insects dangerous for forests.

Ticks are very small arachnids that prefer wet, grassy areas or deciduous forests and shrubs.

They are dangerous for people because they transmit diseases.

Insects usually have three pairs of legs and antennae on their heads. Some of them have one or two pairs of wings so they can fly. Some insects feed on blood, e.g. mosquitoes. Some insects are beneficial, e.g. bees, because they pollinate flowers; others are forest pests, e.g. aphids or the European spruce bark beetle.

The difference between snails and slugs is that snails have shells and slugs do not. They are omnivorous and clean the forest floor. They eat leaves, other dead animals, mushrooms and the like.

1) What animals are part of the forest ecosystem?

2) How do spiders hunt their preys?

3) Why are ticks threatening for humans?

4) What roles can insects play?

5) How are snails and slugs different?
